DETAILED ACTION

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after allowance or after an Office action under *Ex Parte Quayle*, 25 USPQ 74, 453 O.G. 213 (Comm'r Pat. 1935). Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, prosecution in this application has been reopened pursuant to 37 CFR 1.114. Applicants' submission filed on November 19, 2010 has been entered.

The information disclosure statement (IDS) submitted on November 19, 2010 was filed after the mailing date of the allowance of application on August 27, 2010. The submission is in compliance with the provisions of 37 CFR 1.97. Accordingly, the information disclosure statement is being considered by the examiner.

Claims 1, 4-8, 10, 11, 13, 14, 17, 19, 22, 23, and 50-65 are pending and an action on the merits is as follows.

Allowable Subject Matter

1. Claims 1, 4-8, 10, 11, 13, 14, 17, 19, 22, 23, and 50-65 are allowed.
2. The following is an examiner's statement of reasons for allowance:

In reference to claim 1, the prior art does not teach nor suggest a support apparatus having two item support rails, each partially supported by a shared rail

Art Unit: 2832

support leg to which each of said two item support rails is coupled by a different pivot coupler, two additional rail support legs, each partially supporting a different one of said two item support rails, wherein each of said rail support legs has a lower end adapted to rest on a lower supporting surface, wherein each of said pivot couplers pivotally couples only one of the item support rails to the shared rail support leg, said shared rail support leg defining a substantially vertical axis, wherein one of the pivot couples is established at an upper site on said shared rail support leg that is above a lower site on the shared rail support leg at which the other of the pivot couplers is established, where said each of said pivot couplers comprises separable first and second compression elements compressed toward each other in an oppositely facing orientation with at least one compression enhancement element and around a rail terminus of one of said item support rails and a portion of said shared rail support leg, where each of said pivot couplers enables rotatable motion of the item support rail that it couples independently about said substantially vertical axis, wherein each of said pivot couplers enables independent substantially purely vertical translatory height adjustment of a different one of said item support rails relative to said shared rail support leg, wherein said rail terminus defines a rail terminus interface and wherein said each of said pivot couplers establishes at least one cable port and a cable channel that directs a cable from travel in a first direction internally through the item support rails it couples and along a rail axis defined thereby to travel through at least a portion of said cable channel in a second, different direction and out through a cable port, wherein said second different direction is substantially parallel with said substantially vertical axis defined by said shared rail

support leg. The combinations of the claimed limitations are novel and found to be allowable over prior art. The cited references taken singly or in combination do not anticipate nor make obvious applicant's claimed invention.

In reference to claim 13, the prior art does not teach nor suggest a support apparatus having two item support rails, each partially supported by a shared rail support leg, two additional rail support legs, each partially supporting a different one of said two item support rails, wherein each of said rail support legs has a lower end adapted to rest on a lower supporting surface, two pivot couplers, each coupling a different one of said two item support rails to the shared rail support leg, said shared rail support leg defining a substantially vertical axis about which said two pivot couplers are independently rotatable and said two item support rails are independently rotatable, where each of said pivot couplers couples only one of said two item support rails, where said each of said pivot couplers comprises separable first and second compression elements compressed toward each other in an oppositely facing orientation with at least one compression enhancement element and around both, a rail terminus of a different one of said two item support rails and a portion of said shared rail support leg, wherein each of said two pivot couplers is a height adjust coupler that enables substantially purely vertical translatory height adjustment of the item support rail coupled thereby independently of the substantially purely vertical translatory height adjustment enabled by the other of the two pivot couplers, where at least one of the two pivot couplers establishes two cable ports and a cable channel between the two cable ports, wherein said cable channel guides a cable from travel in a first direction through a rail terminus

Art Unit: 2832

interface defined by a coupled item support rail through at least a portion of said cable channel and then in a second different direction through one of the two cable ports, where said second different direction is substantially parallel with said substantially vertical axis defined by the shared rail support leg. The combinations of the claimed limitations are novel and found to be allowable over prior art. The cited references taken singly or in combination do not anticipate nor make obvious applicant's claimed invention.

Claims 4-8, 10, 11, 14, 17, 19, 22, 23, and 50-65 depend on claims 1 or 13 and therefore inherit all allowed claim limitations.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
